800-137	Continuous monitoring program: define, establish, implement, analyze and report				
800-145	Cloud computing standards				
FIPS	Federal Information Processing Standards				

CISSP Cheat Sheet Series Domain 3: Security Engineering Security Models and Concepts **Security Models** System Evaluation and Assurance Levels Hardware architecture Security architecture frameworks - Provides access rights including discretionary access control Evaluates operating systems, application and systems. But not Simultaneous running of **Trusted Computer** Multitasking MATRIX to subjects for different objects. network part. Consider only about confidentiality. Operational two or more tasks. A 2D model considering interrogations such as what, where System Evaluation (Access control model) - Read, write and execute access defined in ACL as matrix assurance requirements for TCSEC are: System Architecture, Simultaneous running of Zachman Framework and when with, etc. With various views such as planner, owner, Criteria Multi programming columns and rows as capability lists. System Integrity, Covert Channel analysis, Trusted Facility two or more programs designer etc. (TCSEC) Management and Trusted recovery. -A subject cannot read data at a higher security level. (A.K.A. CPU consists or more Sherwood Applied Multi-processing simple security rule) A collection of criteria based on the Bell-LaPadula model used than one processor **Business Security** To facilitate communication between stakeholders Subject in a defined security level cannot write to a lower Orange Book to grade or rate the security offered by a computer system Architecture (SABSA) **Processing Types** security level unless it is a trusted subject. (A.K.A *-property Information Technology One security level at a **BELL-LAPADULA** (star property) rule Single State Similar to the Orange Book but addresses network security. Red Book Infrastructure Library Set of best practices for IT service management (Confidentiality model) - Access matrix specifies discretionary access control. Green Book Password Management (ITIL) Multiple security levels at - subject with read and write access should write and read at Multi State Evaluates operating systems, application and systems. But not Security architecture documentation a time. the same security level (A.K.A Strong star rule :) **Trusted Computer** network part. Consider only about confidentiality. Operational Establish security controls published by Standardization (ISO) - Tranquility prevents security level of subjects change between Software built in to in the System Evaluation ISO/IEC 27000 Series assurance requirements for TCSEC are: System Architecture, Firmware and the Electrotechnical Commission (IEC) ROM Criteria System Integrity, Covert Channel analysis, Trusted Facility (TCSEC) Control Objectives for Cannot read data from a lower integrity level (A.K.A The **Base Input Output** Set of instructions used to Management and Trusted recovery. Define goals and requirements for security controls and the Information and Related simple integrity axiom) System (BIOS) load OS by the computer. mapping of IT security controls to business objectives. Consider all 3 CIA (integrity and availability as well as Technology (CobiT) - Cannot write data to an object at a higher integrity level. ITSEC confidentiality **Mobile Security** BIBA (A.K.A the * (star) integrity axiom) Types of security models (Integrity model) - Cannot invoke service at higher integrity. (A.K.A The **TCSEC** Explanation Device Encryption • Remote wiping • Remote lock out Check each of the possible system state and ensure the proper invocation property) D Minimal protection Internal locks (voice, face recognition, pattern, pin, State Machine Models security relationship between objects and subjects in each - Consider preventing information flow from a low security level password) • Application installation control • Asset state. DAC; Discretionary Protection (identification, authentication C1 to a high security level. tracking (IMIE) · Mobile Device Management · resource protection) Allocate each security subject a security label defining the User: An active agent Removable storage (SD CARD, Micro SD etc.) C2 highest and lowest boundaries of the subject's access to the DAC; Controlled access protection Multilevel Lattice Models • Transformation Procedure (TP): An abstract operation, such system. Enforce controls to all objects by dividing them into B1 IoT & Internet Security MAC; Labeled security (process isolation, devices) as read, writes, and modify, implemented through levels known as lattices. B2 MAC; Structured protection Programming Network Segmentation (Isolation) • Logical Isolation Arrange tables known as matrix which includes subjects and · Constrained Data Item (CDI): An item that can be manipulated В3 MAC; security domain (VLAN) • Physical isolation (Network segments) • Matrix Based Models objects defining what actions subjects can take upon another only through a TP MAC; verified protection Application firewalls • Firmware updates Α • Unconstrained Data Item (UDI): An item that can be **CLARK WILSON** Common criteria assurance levels Consider the state of the system at a point in time for a manipulated by a user via read and write operations **Physical Security** (Integrity model) EAL0 Inadequate assurance Noninterference Models subject, it consider preventing the actions that take place at Enforces separation of duty Internal vs external threat and mitigation one level which can alter the state of another level. EAL1 Functionality tested Requires auditing EAL2 Hurricanes, tornadoes, earthquakes Structurally tested Commercial use Try to avoid the flow of information from one entity to another Natural threats Information Flow Models floods, tsunami, fire, etc - Data item whose integrity need to be preserved should be EAL3 which can violate the security policy. Methodically tested and checked Politically EAL4 Methodically designed, tested and reviewed Read and Write are allowed or restricted using a specific Confinement - An integrity verification procedure (IVP) -scans data items and motivated Bombs, terrorist actions, etc EAL5 memory location, e.g. Sandboxing. Semi-formally designed and tested confirms their integrity against external threats threats EAL6 Semi-formally verified, designed and tested Data in Use Scoping & tailoring Information is restricted to flow in the directions that are Power/utility General infrastructure damage EAL7 Formally verified, designed and tested Information flow model permitted by the security policy. Thus flow of information from Security Modes supply threats (electricity telecom, water, gas, etc) ITSEC security evaluation criteria - required levels one security level to another. (Bell & Biba). Man Made D + E0 Minimum Protection Use a single classification level. All objects can access all Sabotage, vandalism, fraud, theft - Use a dynamic access control based on objects previous threats Dedicated Security Mode subjects, but users they must sign an NDA and approved prior C1 + E1 Discretionary Protection (DAC) Liquids, heat, gases, viruses, to access on need-to-know basis C2 + E2 Controlled Access Protection (Media cleansing for reusability) Major sources Subject can write to an object if, and only if, the subject bacteria, movement: (earthquakes), Brewer and Nash All users get the same access level but all of them do not get B1 + E3 to check Labelled Security (Labelling of data) cannot read another object in a different dataset. System High Security radiation, etc (A.K.A Chinese wall the need-to-know clearance for all the information in the B2 + E4 Structured Domain (Addresses Covert channel) Prevents conflict of interests among objects. Mode **Natural threat control measures** model) B3 + E5 Security Domain (Isolation) Move or check location, frequency of Hurricanes, In addition to system high security level all the users should https://ipspecialist.net/fundamental-concepts-of-security-mod A + E6 Verified Protection (B3 + Dev Cycle) Compartmented Securit Tornadoes, occurrence, and impact. Allocate have need-to-know clearance and an NDA, and formal approval els-how-they-work/ Common criteria protection profile components Mode Earthquakes budget. for all access required information. Lipner Model Commercial mode (Confidentiality and Integrity,) -BLP + Biba Descriptive Elements • Rationale • Functional Requirements • Development assurance Raised flooring server rooms and Use two classification levels as System Evaluation and Floods Rule 1: Transfer Access, Rule 2: Grant Access, Rule 3: Delete Graham-Denning Model requirements • Evaluation assurance requirements Multilevel Security Mode offices to keep computer devices **Assurance Levels** Objects, subjects and 8 Access, Rule 4: Read Object, Rule 5: Create Object, Rule 6: **Certification & Accreditation** Electrical UPS, Onsite generators destroy Object, Rule 7: Create Subject, Rule 8: Destroy Evaluation of security and technical/non-technical features to ensure Virtualization Certification Fix temperature sensors inside Harrison-Ruzzo-Ullman Restricts operations able to perform on an object to a defined if it meets specified requirements to achieve accreditation. server rooms, Communications Guest operating systems run on virtual machines and hypervisors run on one or more Model set to preserve integrity. Declare that an IT system is approved to operate in predefined Accreditation Redundant internet links, mobile host physical machines. conditions defined as a set of safety measures at given risk level. Web Security communication links as a back up to Virtualization security **NIACAP Accreditation Process** Trojan infected VMs, misconfigured hypervisor cable internet. threats Open-source application security project. OWASP creates Phase 1: Definition • Phase 2: Verification • Phase 3: Validation • Phase 4: Post **Man-Made Threats OWASP** Software as A Service (SaaS), Infrastructure As A Service guidelines, testing procedures, and tools to use with web Accreditation Cloud computing models Avoid areas where explosions can (laaS), Platform As A Service (PaaS) Accreditation Types **Explosions** occur Eg. Mining, Military training Injection / SQL Injection, Broken Authentication, Sensitive Data Account hijack, malware infections, data breach, loss of data Cloud computing threats Type Accreditation Evaluates a system distributed in different locations. etc. Exposure, XML External Entity, Broken Access Control, Security Minimum 2 hour fire rating for walls, System Accreditation Evaluates an application system. **OWASP Top 10** Misconfiguration, Cross-Site Scripting (XSS), Insecure Fire **Memory Protection** Fire alarms, Fire extinguishers. Site Accreditation Evaluates the system at a specific location. Deserialization, Using Components with Known Vulnerabilities, Deploy perimeter security, double Insufficient Logging and Monitoring Vandalism Directly access inbuilt CPU memory to access CPU and ALU Register Symmetric vs. Asymmetric Encryption locks, security camera etc. Attackers try to exploit by allowing user input to modify the Stack Memory Segment Used by processors for intercommunication. Use measures to avoid physical back-end/server of the web application or execute harmful Use a private key which is a secret key between two parties. SQL Injections: Monolithic Operating Fraud/Theft access to critical systems. Eg. code which includes special characters inside SQL codes All of the code working in kernel mode/system. Each party needs a unique and separate private key. System Architecture Fingerprint scanning for doors. results in deleting database tables etc. Symmetric Algorithms Number of keys = x(x-1)/2 where x is the number of users. Eq. Memory Addressing Identification of memory locations by the processor. SQL Injection prevention: Validate the inputs and parameters. DES, AES, IDEA, Skipjack, Blowfish, Twofish, RC4/5/6, and Site Selection Register Addressing CPU access registry to get information. **Cross-Site Scripting** Attacks carryout by inputting invalidated scripts inside Immediate Addressing Part of an instruction during information supply to CPU. **Deter Criminal Activity - Delay** (XSS) Stream Based Symmetric Encryption done bitwise and use keystream generators Eg. **Physical** Intruders - Detect Intruders - Assess Actual address of the memory location is used by CPU. Direct Addressing Attackers use POST/GET requests of the http web pages with Cipher security goals Situation - Respond to Intrusion HTML forms to carry out malicious activity with user accounts. Indirect Addressing Same as direct addressing but not the actual memory location Encryption done by dividing the message into fixed-length **Block Symmetric Cipher** Visibility - External Entities -**Cross-Request Forgery** Prevention can be done by authorization user accounts to carry blocks Eg. IDEA, Blowfish and, RC5/6. Base + Offset Addressing Value stored in registry is used as based value by the CPU Site selection Accessibility - Construction - Internal the actions. Eq. using a Random string in the form, and store it Use public and private key where both parties know the public *Citation CISSP SUMMARY BY Maarten De Frankrijker issues on the server. Compartments and the private key known by the owner . Public key encrypts · Middle of the building (Middle Cryptographic Terminology the message, and private key decrypts the message. 2x is total Cryptography Asymmetric Algorithms floor) number of keys where x is number of users. Eg. Diffie-Hellman, Convert data from plaintext to cipher text. **Encryption** Single access door or entry point • P - Privacy (Confidentiality) RSA, El Gamal, ECC, Knapsack, DSA, and Zero Knowledge Decryption Convert from ciphertext to plaintext. Fire detection and suppression A – Authentication Server room Proof. Cryptography Goals • I - Integrity security systems Key A value used in encryption conversion process. Symmetric Algorithms Asymmetric Algorithms Hybrid Cryptography (P.A.I.N.) · N - Non-Repudiation. Raised flooring Synchronous Encryption or decryption happens simultaneously. Use of both Symmetric and Redundant power supplies Use of private key which is a Use of public and private key Asymmetric encryption. Eg. Encryption or decryption requests done subsequently or after a Key space = 2n. (n is number of key bits) Solid /Unbreakable doors **Asynchronous** secret key SSL/TLS Confidentiality 8 feet and taller with razor wire. Single private key use for encryption and decryption. Fences and Symmetric Provide integrity. One way Integrity Remote controlled underground Provides confidentiality but Provides confidentiality. Gates Proof of origin function divides a message Key pair use for encrypting and decrypting. (One private and Use of Cryptography integrity, authentication, and concealed gates. not authentication or **Asymmetrical** or a data file into a smaller Non-repudiation one public key) nonrepudiation nonrepudiation Infrared Sensors - Electromechanical Perimeter fixed length chunks. Protect data at rest Use to verify authentication and message integrity of the Intrusion Systems - Acoustical Systems Protect data in transit One key encrypts and One key encrypts and other Encrypted with the private **Digital Signature** sender. The message use as an input to a hash functions for CCTV - Smart cards -Detection key decrypts key of the sender. decrypts validating user authentication. Codes vs. Ciphers **Systems** Fingerprint/retina scanning Message Authentication A one-way function, convert message to a hash value used to Continuous Lighting - Standby Lighting Substitution cipher, Transposition cipher, Caesar Cipher, Code (MAC) used to encrypt Larger key size. Bulk Hash verify message integrity by comparing sender and receiver **Classical Ciphers** Lighting - Movable Lighting Small blocks and key sizes the hash function with a **Systems** encryptions Emergency Lighting symmetric key. **Modern Ciphers** Block cipher, Stream cipher, Steganography, Combination. **Digital Certificate** An electronic document that authenticate certification owner. Offsite media storage - redundant Faster and less complex. Not Slower. More scalable. Allows for more trade-offs Media storage Cipher converts Plaintext to another written text to hide original Simple text message. Plaintext backups and storage Concealment Cipher between speed, complexity, scalable Normal text converted to special format where it is unreadable Faraday Cage to avoid and scalability. Ciphertext Uses a key to substitute letters or blocks of letters with without reconversion using keys. electromagnetic emissions - White Hash Functions and Digital **Substitution Ciphers** different letters or block of letters. I.e. One-time pad, **Electricity** noise results in signal interference The set of components used for encryption. Includes Certificates Cryptosystem stenography. Control Zone: Faraday cage + White algorithm, key and key management functions Out-of-band key exchange In-band key exchange Hashing use message Reorder or scramble the letters of the original message where noise Breaking decrypting ciphertext without knowledge of digests. Cryptanalysis Transposition Ciphers the key used to decide the positions to which the letters are Use anti-static spray, mats and cryptosystem used. moved **Key Escrow and Recovery** wristbands when handling electrical Static **Cryptographic Algorithm** Procedure of enciphers plaintext and deciphers cipher text.

Certificate validity from top level.

Used to check certificate validity online

Digital Signatures

Digital signature is generated by the user's public key and validity period according to

Digital Certificate - Steps

Enrollment - Verification - Revocation

Cryptography Applications & Secure Protocols

• BitLocker: Windows full volume encryption feature (Vista

A hardware chip installed on a motherboard used to manage

Encrypts entire packet components except Data Link Control

Privacy (Encrypt), Authentication (Digital signature), Integrity,

(Hash) and Non-repudiation (Digital signature) Email (Secure

MIME (S/MIME): Encryption for confidentiality, Hashing for

integrity, Public key certificates for authentication, and

SSL/TLS. SSL encryption, authentication and integrity.

(Privacy, authentication, Integrity, Non Repudiation)

Tunnel mode encrypt whole packet (Secure). Transport mode

Authentication Header (AH): Authentication, Integrity, Non-

repudiation. Encapsulated Security Payload (ESP): Privacy

Authentication, and Integrity. Security Association (SA):

Internet Security Association Key Management Protocol

Key exchange used by IPsec .Consists of OAKLEY and

Authentication, use to create and manage SA, key generation.

Internet Security Association and Key Management Protocol

(ISAKMP). IKE use Pre-Shared keys, certificates, and public key

Wired Equivalent Privacy (WEP): 64 & 128 bit encryption. Wi-Fi

Protected Access (WPA): Uses TKIP. More secure than WEP

WPA2: Uses AES. More secure than WEP and WPA.

Create a trust relationship between two CA's

Distinct Identifier of a secure connection.

Message Digests for nonrepudiation.

encrypt payload (Faster)

authentication.

truecrypt: freeware utility for on-the-fly encryption

Symmetric and asymmetric keys, hashes, and digital

certificates. TPM protect passwords, encrypt drives, and

Packet routing, headers, and addresses not encrypted.

Domain 6: Security Assessment & Testing

Sc	oftware Testing
Static Testing	Software security analysis using automated tools. Do not analyze either the source code or the compiled application. Eg. Buffer overflow
Dynamic Testing	Analyze and test using running environment. Use to test software provided by third parties where no access to software code. Eg. cross-site scripting, SQL injection
Fuzz Testing	Type of dynamic testing which use specific inputs to detect flaws under stress/load. Eg. input invalid parameters to test
Mutation / Dumb Fuzzing	Using already modified input values to test.
Generational / Intelligent Fuzzing	Inputs models of expected inputs.
Misuse Case Testing	Evaluate the vulnerability of known risks and attacks.
Interface Testing	Evaluate performance of software modules against the interface specifications to validate working status.
Application Programming Interfaces (APIs)	Test APIs to verify web application meets all security requirements.
User Interfaces (UIs)	Includes graphic user interfaces (GUIs) and command-line interfaces (CLI). Review of user interfaces against requirement specifications.
Physical Interfaces	Eg. in physical machines such as ATM, card readers etc.
Unit Testing	Testing a small part of the system to test units are good for integration into final product.
Integration Level Testing	Transfer of data and control between program interfaces.
System Level Testing	Verify system has all the required specifications and functions.

Log Management System				
OPSEC process	Analyze daily operations and review possible attacks to apply countermeasures.			
Pen-test	Testing of network security in view of a hacker.			
Port scanner	Check any port or port range open in a computer.			
Ring zero	Internal code of the system.			
Operational assurance	Verify software meets security requirements.			
Supervisor mode	Processes running in internal protected ring.			

Threat Assessment Modeling

	<u> </u>
STRIDE	Evaluate threats against applications or operating systems.
Spoofing	Use of false identity to gain access to system identity. Can use IP/ MAC address, usernames, wireless network SSIDs.
Tampering	Cause unauthorized modifications of data in transit or in storage. Results in violation of integrity as well as availability.
Repudiation	Deny an action or activity carried out by an attacker.
Information disclosure	Distribution of private/confidential or restricted information to unauthorized parties.
Elevation of privilege	Attack result in increase the level privileges for a limited user account.
Regular monitoring of key performance and	Number of open vulnerabilities and compromised accounts, vulnerability resolve time, number of detected

Automatically probe systems, applications, and

Sends a packet with SYN flag set. Also known as

necessary permissions to run a half-open scan.

Sends a packet with the ACK flag set.

Perform when a user running the scan does not have the

Sends a packet with the FIN, PSH, and URG flags set.

Detect rogue scanning devices in wireless networks.

Read-only account to access configuration files.

software flaws etc.

"half-open" scanning.

Software Development Security Best Practices

WASC	Web Application Security Consortium
OWASP	Open Web Application Security Project
BSI	the Build Security In initiative
IFC	The International Electrotechnical Commission

Security Testing

To make sure security controls are properly applied and in use. Automated scans, vulnerability assessments and manual testing.

Software Threats

Viruses	Stealth virus • Polymorphic virus • Macro virus • • Spyware/Adware • Botnet • worm				
Rootkit	Kernel-mode Rootkit • Bootkit • User-mode Rootkit • Virtual Rootkit • Firmware Rootkit				
Source Code Issues	Buffer Overflow • Escalation of Privileges • Backdoor				
Malware Protection	Antivirus software • Antimalware software • Security Policies				

Considerations

- Resources availability
- Level of critical and sensitiveness of the system under testing
- Technical failures
- Control misconfigurations result in security loopholes
- Security attack risks
- Risk of performance changes
- · Impact on normal operations

Verification & Validation

- Verification SDLC design output meets requirements
- · Validation Test to ensure software meets requirements

Security Software

- Antimalware and Antivirus Scan and log malware and virus detection
- IDS/IPS = Real time and promiscuous monitoring for attacks
- Network-based IDS
- Local network monitoring and passive and header level scanning .No host level scan.
- HOST BASED
- Monitor hosts using event logs
- Intrusion prevention system (IPS) Attack detects and prevent
- Remote Access Software Should be access via a VPN
- Vulnerability assessment Software should be updated and patched
- Routers policy based access control

Logs

Network Flow	Network traffic capture
Audit logging	Events related to hardware device login and access
Network Time Protocol (NTP)	Should synchronize across entire network to have correct and consistent time in logs and device traffic flows.
Syslog	Device event message log standard.
Event types	Errors, Warnings, Information, Success Audits, Failure
Simple Network Management Protocol (SNMP)	Support for different devices such as Cisco.

Monitoring and auditing

Define a clipping level. A.K.A BASELINE

- Audit trails event/transaction date/time, author /owner of the event
- Availability Log archival

Integration Testing

• Log Analysis – examine logs

Code Review and Testing

Person other than the code writer/developer check the code to find errors

Fagan inspections – steps	Planning • Overview • Preparation • Inspection • Rework • Follow-up
Code Coverage Report	Details of the tested code structure
Use cases	Percentage of the tested code against total cases
Code Review Report	Report create in manual code testing
Black-box testing	Test externally without testing internal structure
Dynamic Testing	Test code in run time
White-box testing	Detailed testing by accessing code and internal structure
CVE	Common Vulnerability and Exposures dictionary
CVSS	Common Vulnerability Scoring System
NVD	National Vulnerability Database
Regression Testing	Verify the installations required for testing do not have any issues with running system

Test using two or more components together

• Internal /external communications

Detailed plans by team members

HR involvement
